RE: PHYSICAL MATTRESS TESTING

INTRODUCTION

GoodMorning.com has commissioned Techtree Engineering to provide independent 3rd party testing of multiple mattresses, based on an established testing schema prescribed by GoodMorning.com.

Techtree Engineering is an independent 3rd party engineering firm headquartered in Alberta, Canada, with a presence throughout the country.

The testing procedures are described briefly below, and in greater detail in document "TT-GM-01 – AppendixB".

Sincerely,

Techtree Engineering Ltd.

Wes Schroeder, P.Eng.

TESTING METHODOLOGY

a. **Reference Loads** – The equipment used to perform the tests below is as follows:

1. 105 lb Rescue Randy mannequin
2. 65 lb weighted vest
3. Accelerometer
4. 10 lb medicine ball
5. Mattress testing base
6. Levels, tape measure – not shown

Rescue Randy, weighted vest, accelerometer, and mattress testing base (levels/tape measure not shown)

b. **Test Conditions**

All tests were performed in offices equipped with thermostat-based temperature control, which maintains the environment within a specific range.

PART 1 - FIRMNESS TEST:

1. **Objective:** This test is conducted to assess the mattress's level of firmness, verifying that it adheres to the established criteria for comfort and support. This serves as a foundation for comparison, evaluation, and dialogue.
2. **Overview:** This test involves measuring the mattress's resistance to pressure by applying a human equivalent load and assessing its firmness level.
3. **Procedure:** A mannequin weighing 105 lb, outfitted with a weighted vest of 65 lb, was employed to assess the mattresses' deflection levels in comparison to a baseline measurement. These deflection readings help to ascertain the mattress's firmness, with greater deflection indicating a softer mattress.
4. **Formulas and calculations**

Deflection = Neutral measurement - (Deflected measurement + Mannequin thickness at the measurement point).

PART 2 EDGE SUPPORT TEST:

- 1. Objective:** This test aims to assess the edge of the mattress's capability to retain structural integrity and comfort when subjected to pressure. It serves as a foundation for comparison, evaluation, and discussion.
- 2. Overview:** This test involves measuring edge deflection by applying a human-equivalent load at various points along the mattress's perimeter, tailored to the specific type of mattress (hybrid or foam). Results are categorized and scored according to mattress type.
- 3. Procedure:** The edge support of mattresses is evaluated by situating a 105 lb mannequin at the mattress's edge, equipped with a 65 lb weighted vest, and conducting measurements from the thighs down to a predetermined reference point. Multiple measurements are systematically recorded for each mattress as outlined in the following illustrations:

4. Formulas and calculations – all measurements are in inches

Constant values: D1=17 ; Leg thickness Dleg=5.375 at D2, Dleg=6.375 at D3

- Initial Setup and Measurements:
 - D1: Constant distance from the mattress edge to the center of mass of the mannequin.
 - D2: Horizontal reference point established by placing a level on the mannequin's knees.
 - D3: Alternate horizontal reference point, similar to D2.
 - D6: Mattress thickness.
 - D7: Distance from the top of the knees to the foundation base, indicating the height with no sinkage.
- Sinkage Measurement:
 - D measured: The distance from the top of the knees to the foundation base while the mannequin is seated, used to determine the sinkage.
- Deflection Calculations:
 - Deflection at the Knees $D4' = D7 - D \text{ measured}$.
 - Deflection at the Thigh $D4''$: Uses the same formula as $D4'$, calculated at a different point to capture the deflection at thigh level.
- Average Deflection:
 - D4: Average deflection value, obtained by averaging the two measurements ($D4'$ and $D4''$), provides a comprehensive assessment of the mattress edge support.
- Repeat Measurements and Final Calculations:
 - Measurements are repeated at various locations across the mattress according to the mattress type.
 - The average deflection value across all test points and for each mattress type: Hybrid and Foam, is determined, offering a metric for assessing overall edge support.

PART 3 – MOTION ISOLATION:

1. **Objective:** This test aims to assess how much motion transfer is experienced on one side of the mattress from movement on the other.
2. **Overview:** This test involves repeated drops of a medicine ball at a measured distance away from an accelerometer.
3. **Procedure:** The motion isolation of mattresses is evaluated by dropping a medicine ball on a mattress 20 times, and recording the accelerations experienced by an accelerometer. The acceleration is three-dimensional: up-down, left-right, head-toe. These three values are combined into a magnitude acceleration and averaged across the 20 test drops.

4. Formulas and calculations

The vector magnitude of acceleration as shown above in is calculated using the expression shown below.

$$a = \sqrt{x^2 + y^2 + z^2}$$

PART 4 – BOUNCINESS:

1. **Objective:** This test aims to assess how much rebound a mattress exhibits to quantify its bounciness.
2. **Overview:** This test involves repeated drops of a medicine ball and recording the rebound height from the mattress surface.
3. **Procedure:** Drop a 10 lb sphere (9" diameter) from a fixed distance on to the top side of each subject mattress and measure the resultant peak rebound height on its first bounce. A high resultant peak rebound height shall indicate more bounciness, while a low resultant peak height shall indicate less bounciness.

MATTRESS CATEGORIZATION:

Mattresses in this report are categorized into 3 types

1. Foam/Latex
2. Hybrid – Quilted Top
3. Hybrid – Tight/Smooth Top

Earlier reporting combined all hybrid mattresses into a single classification. Our framework has since been refined to differentiate Hybrid Quilted Tops from Hybrid Tight /Smooth Tops, allowing surface construction characteristics to be represented more accurately within the scoring model. This update ensures that variations in the top-layer design are properly accounted for when materials interface with the testing apparatus. As a result, some historical scores have been recalibrated to reflect this improved categorization. The testing protocol and measurement procedures remain unchanged, and all original data sets are fully preserved and available upon request

FIRMNESS TEST RESULTS

Mattress Firmness Measurements (in inches): Foam & Foam/Latex

Mattress	Neutral Measurement (in)	Deflected Measurement (in)	Deflection (in)	Out of 10
